

Dikes and sills

- **Dike (dyke)** – where magma fills and hardens in a crack in a rock. The crack cuts across older rock.

Example - Enfield dikes on the Vanished World Trail

Note - there is no car parking and no public access to this site

- **Sill** – Where the magma hardens under the surface but in the same orientation as other layers of rock

Example - Tokarahi Sill on the Vanished World Trail

Note - there is no car parking and no public access to this site
