

MOA

Moa are now extinct but they used to live in New Zealand! They are one of the biggest birds to have ever lived on earth! Moa were endemic (native) to New Zealand.

Moa became extinct after the arrival of people to New Zealand – they were hunted by humans and Haast's Eagle.

- Reached up to 3.6 metres tall
- Weighed up to around 230 kg
- Had rough brown or black feathers
- Couldn't fly but could run fast
- Ate plants like ferns, twigs and leaves
- Swallowed pebbles or stones to help digest their food – these are called gizzard stones!
- You can see a skeleton of a moa and also real moa footprints preserved in mud (recovered from the Kyebrun River) at the Otago Museum in Dunedin
